

2017 EDITION

The new federal census is based on a register survey that evaluates existing administrative data. To this end, the FSO uses cantonal and communal population registers, federal registers of persons and the Federal Register of Buildings and Dwellings.

Only necessary information that is not contained in a register still has to be collected with an annual structural survey of 200,000 people. Variables that are not contained in the register survey, are estimated with this structural survey.

In this document are listed and described all the variables of statistical data packs provided by MicroGIS. Those data might be used jointly with the corresponding geographic data : Swiss Areas.

Some acronym were slightly changed in order to better fit the standards of geographic data formats. If the acronym has been modified, the previous form is mentioned at the end of the description preceded by the abbreviation *prev. acro.*
